

# Loremaster

A game-night sage for your Discord group

**@mention in Discord**
a question, a screenshot, a dice roll

→

**Claude + your persona**
plus the game you're playing and campaign memory

→

**An answer**
in the channel, as a file, or spoken aloud

*Narrated by Loremaster in his own voice (Kokoro, bm_george). Made with podcast-generator.*

Brien Alkire · github.com/brienalkire/loremaster · MIT license

WHY

# Three things that eat game night

- **Choosing.** The first twenty minutes go on arguing about what to play.
- **Looking things up.** Mid-session, someone needs a build, a tactic or a rule, and nobody wants to alt-tab to a wiki.
- **Forgetting.** After a week away, nobody remembers where the campaign left off.
- Loremaster **suggests games that fit your group**, **advises while you play**, and **remembers every campaign** between sessions.

HOW IT WORKS

# A mention goes in, an answer comes out

### 1. Mention

Someone @mentions the bot in any channel it can see. It never jumps in uninvited.

→

### 2. Think

Claude reads the core rules, your persona, the game extension and campaign memory.

→

### 3. Answer

A chat reply, a Markdown file to keep, or speech in your voice channel.

**One host per group.** One person runs the bot for everyone, with their own Discord bot and Anthropic API key. The rest of the group just mentions it in Discord: nothing to install.

IN A SESSION

# Ask in plain language

**Alice**
@Loremaster where did we leave off last time?

**Loremaster**
You'd just cleared the flooded crypt. Next: return the sigil to the abbess. Bob still carries the cursed amulet. Wisely, nobody has asked him to take it off.

**Bob**
@Loremaster roll 1d20 each for Alice, Bob and Cara

**Loremaster**
Cara wins with 18. Alice 7, Bob 12, Cara 18.

*Illustrative exchange. The names and the campaign are made up.*

MEMORY

# Campaigns that survive a restart

- Each campaign is kept in a **local SQLite database**: the party, objectives, gear and memorable moments.
- The bot **updates it as things happen**, and you can tell it things directly: `remember that Mira is now level 12`.
- **One active campaign at a time.** Switching changes the game extension straight away, with no restart.
- A **game extension** is a folder of your own notes for one game. It can also turn on extra tools, such as an item lookup.

TOOLS

# More than a chat model

### Real dice

From the computer's random source, never the model's guess. Says who rolled highest.

### Live Steam data

Price, sales, co-op support, and how many people still play.

### Web search

Recent patch notes and news the model can't know.

### Screenshots and files

Reads character sheets, inventory screens, and attached .md or .txt files.

### Replies as files

Ask for a "file" and the answer comes back as a Markdown download.

### Wish list and bugs

Kept per group. The owner can send any item on as a GitHub issue.

VOICE

# Spoken replies, and an ear (if you want one)

### Speak: `speak on`

Joins your voice channel and reads its replies aloud. Speech runs **on your computer** with Kokoro: no cost per reply. A few seconds on a CPU; much faster with an NVIDIA GPU.

### Listen: `listen on` (experimental)

Off by default. Say its name and a question, and it answers. Needs a separate speech-to-text server. **It hears everyone in the channel**, so tell your group first.

> The voice narrating this video is the one Loremaster uses on game night.

PERSONA

# You decide who it is

```
## Persona & interaction style

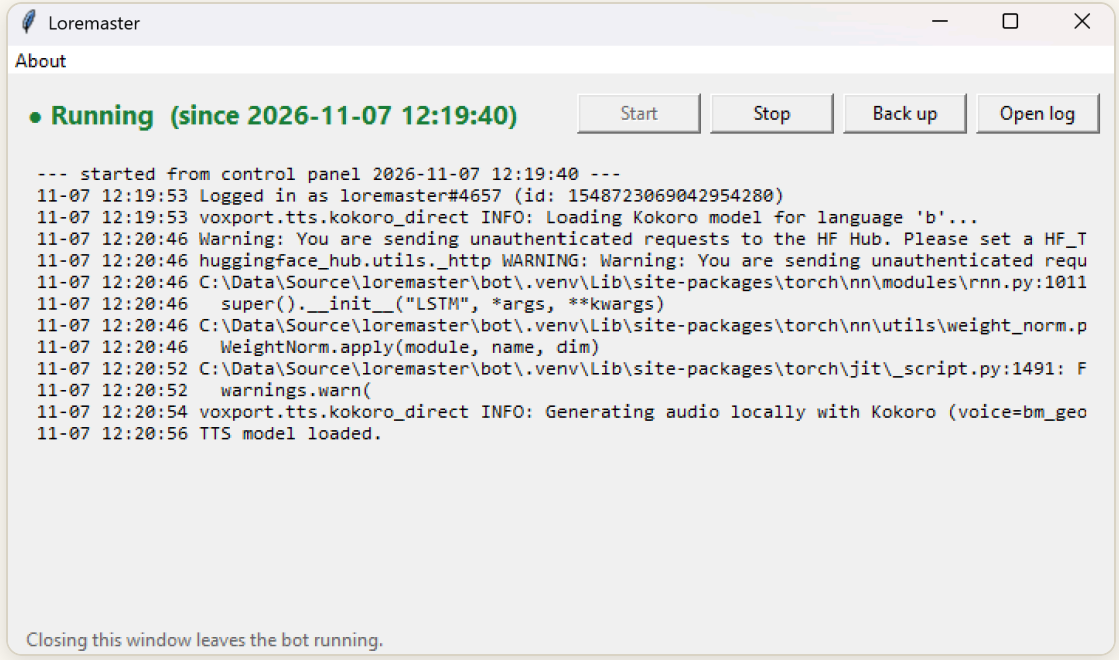

Speak as "the Loremaster": a learned,
slightly theatrical sage who has read
every strategy guide worth reading and
doesn't mind people knowing it. A little
self-satisfied, with an occasional dry
aside, but never mean.
```

*From the example persona that ships with the bot*

- A **persona file** your group writes: who's in the group, what you play, what to avoid, how it talks.
- Change the personality entirely, or keep the sage.
- It's **sent to Anthropic with every reply**: keep it focused, and private details out.
- **Only messages that mention the bot**, and its replies, go to Anthropic. The rest of your chat stays in Discord.

RUNNING IT

# A small control panel (Windows)

*The Loremaster control panel*

- **Start** and **stop** the bot.
- **Back up** the database as readable SQL, and optionally commit and push it.
- Keep backups in a **private** repository: they hold your group's campaign notes.
- **Open log** shows status messages and errors, never chat messages.

BEFORE YOU INSTALL

# What the host needs

- **Python 3.12** (the tested version) and **Git**.
- **ffmpeg** on your PATH, only for spoken replies.
- **About 2 GB of disk** for the packages and the speech model.
- **A Discord account** allowed to add bots to your server.
- **An Anthropic account with API credit.** You pay per reply: watch Usage at first and set a monthly limit. Steam lookups and speech are free.
- **Tested on Windows 11.** The bot should run elsewhere; the control panel is Windows-only.

> Everyone else in the group needs only Discord.

GET STARTED

# Clone it and summon your own

```
git clone https://github.com/brienalkire/loremaster.git
```

- **Install:** `pip install -r requirements.txt`, then put your Discord token and API key in `.env`.
- **Docs:** README for a quick start, MANUAL for everything else, and HOW_TO_TALK_TO_LOREMASTER for your group.
